before this lecture.

The generalized Galerkin method

motivation: in practice (Q. Chap. 13)

FEM assembly process computed
using quadratures.

Instead of:

compute approximations

$$\mathcal{A}(u_h, v_h) \approx \mathcal{A}_h(u_h, v_h)$$

$$F(v_h) \approx F_h(v_h)$$

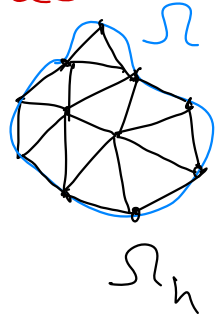

A form of VARIATIONAL CRIME

* 1. $\Omega \approx \Omega_h$, $F \approx F_h$

2. $V_h \not\subset V$ non-conforming discrete spaces

3. $\Omega_h = \bigcup_{T \in \mathcal{T}_h} T \neq \Omega$

e.g., if Ω is curved

Analysis of variational crime 1

$\Omega_h = \Omega$, $V_h = V_h^k \subset V$, consider

Ω_h, F_h and the generalised Galerkin

Method : Find $u_h \in V_h$:

$$a_h(u_h, v_h) = F_h(v_h) \quad \forall v_h \in V_h$$

Galerkin orthogonality
(=full consistency)
does not hold.

Recall: Galerkin orthogonality:

$$a(u - u_h, v_h) = 0 \quad \forall v_h \in V_h$$

Truncation error:

$$T_h(v_h) := \mathcal{F}_h(u, v_h) - F_h(v_h)$$

• If $T_h \equiv 0 \rightarrow$ strong (full) consistency
 \hookrightarrow Cea Lemma

• otherwise require $T_h \rightarrow 0$ for consistency

\hookrightarrow Strong Lemmas

Def (uniform V_h -ellipticity):

$\mathcal{F}_h : V_h \times V_h \rightarrow \mathbb{R}$ is UNIFORMLY

V_h -elliptic if $\exists \tilde{\alpha} > 0 : \forall v_h$

$$\mathcal{F}_h(v_h, v_h) \geq \tilde{\alpha} \|v_h\|_V^2 \quad \forall v_h \in V_h$$

[See Ciarlet, ch. 4; Q. Lemma 10.1,
Q. Sec. 13.8.4 about Generalised Galerkin]

Theorem (1st strong Lemma)

Let $V_h \subset V$ Sequence of subspaces, \mathcal{A}_h, F_h
discrete forms approximating \mathcal{A}, F .

If $F_h \in V'$, \mathcal{A}_h is unif. V_h -elliptic,
then

Well-posed $\left\{ \begin{array}{l} \bullet \exists! u_h \in V_h \text{ solution of the generalized} \\ \text{Galerkin method } \mathcal{A}_h(u_h, v_h) = F_h(v_h) \forall v_h \in V_h \\ \bullet \|u_h\|_V \leq \frac{1}{2} \|F_h\|_{V'} \end{array} \right.$ Cea

$$\bullet \|u - u_h\|_V \leq \inf_{v_h \in V_h} \left[\left(1 + \frac{\gamma}{2}\right) \|u - v_h\|_V \right. \\ \left. + \frac{1}{2} \sup_{\substack{w_h \in V_h \\ w_h \neq 0}} \frac{|\mathcal{A}(v_h, w_h) - \mathcal{A}_h(v_h, w_h)|}{\|w_h\|_V} \right] + \frac{1}{2} \sup_{\substack{w_h \in V_h \\ w_h \neq 0}} \frac{|F(w_h) - F_h(w_h)|}{\|w_h\|_V}$$

Proof: Well-posedness follows by
 Lax-Milgram applied to \mathcal{A}_h, F_h .

$$\|u - u_h\|_V \leq \|u - v_h\|_V + \|v_h - u_h\|_V \quad \forall v_h \in V_h$$

$$2 \|\tilde{w}_h\|_V^2 \leq \mathcal{A}_h(u_h - v_h, \tilde{w}_h) \quad \text{by uniform } V_h\text{-ellipticity}$$

$$\|\tilde{w}_h\|_V = F_h(\tilde{w}_h) - \mathcal{A}_h(v_h, \tilde{w}_h) \quad \text{use Gen. Galerkin}$$

$$+ \underbrace{\mathcal{A}(u - v_h, \tilde{w}_h) - F(\tilde{w}_h)}_{=0}$$

$$+ \underbrace{\mathcal{A}(v_h, \tilde{w}_h)}_{=0}$$

by cont.-
problem

$$= \mathcal{A}(u - v_h, \tilde{w}_h) + (\mathcal{A} - \mathcal{A}_h)(v_h, \tilde{w}_h) + (F_h - F)(\tilde{w}_h)$$

$$\leq \gamma \|u - v_h\|_V \underbrace{\|\tilde{w}_h\|_V}_{\|\tilde{w}_h\|_V} + |(\mathcal{A} - \mathcal{A}_h)(v_h, \tilde{w}_h)| / \|\tilde{w}_h\|_V + |(F - F_h)(\tilde{w}_h)| / \|\tilde{w}_h\|_V$$

$$\|u_h - v_h\|_V \leq \frac{\gamma}{2} \|u - v_h\|_V$$

$$+ \frac{1}{2} \left(\frac{|(A - A_h)(v_h, \tilde{w}_h)|}{\|\tilde{w}_h\|_V} + \frac{|(F - F_h)(\tilde{w}_h)|}{\|\tilde{w}_h\|_V} \right)$$

• take inf over v_h and sup over w_h .

Example: Poisson, FEM with quadratures

$$\text{Let } V = H_0^1(\Omega); \quad \mathcal{A}(u, v) = \int_{\Omega} A \nabla u \cdot \nabla v$$

$$F(v) = \int_{\Omega} f v$$

$$T = (a_{ij})_{ij}$$

Theorem; Assume: $\begin{cases} \bullet a_{ij} \in W^{k, \infty} \\ \bullet f \in W^{k, q} \end{cases} \begin{cases} q \geq 2, \\ k > \frac{d}{q} \end{cases}$

$u \in H_0^1(\Omega) \cap H^{k+1}(\Omega)$. Let A_h, F_h computed by element wise on every $T \in \mathcal{T}_h$

using quadrature exact on $P^{2k-2}(T)$.

[example: $k=1$, then need exact on constants]

Then, $|u - u_h|_1 \leq Ch^k (|u|_{k+1} + \sum_{j=1}^d \|a_{x_j}\|_{k,\infty} \|u\|_{k+1} + \|f\|_{W^{k,q}})$

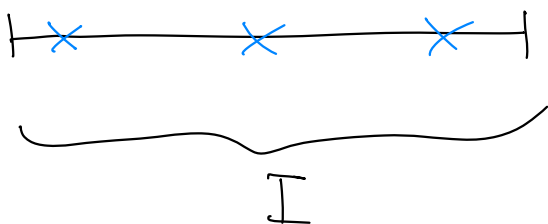

On quadrature formulae

• Given T , $\int_T g(x) dx \approx \underbrace{\sum_{j=1}^{n_q} w_j g(x_j)}_{Q(g)}$
 (w_j, x_j) set of quadrature weights and nodes

A quadrature rule is of order m if

$$Q(p) = \int_T p(x) dx \quad \forall p \in \mathbb{P}^m(T)$$

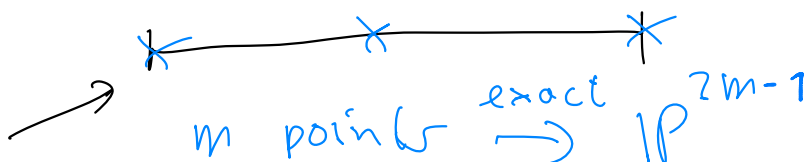

- Gauss quadrature: maximal order of quadrature for a given number of q points. \rightarrow available of any order for the interval

$$\int_I f(x) dx$$

m points $\xrightarrow{\text{exact}} \mathbb{P}^{2m-1}$

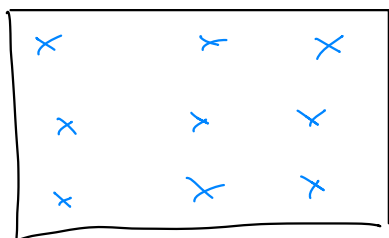

+ } Gauss-lobatto versions include end points

m points $\xrightarrow{\text{exact}} \mathbb{P}^{2m-1}$

← Over rectangle

Gauss

Gauss

by tensor product
of 1D Gauss
obtain quadr.
rules for rectangle

$$\begin{array}{c|c} \mathbb{P}^1 & \mathbb{Q}^1 \\ \hline 1, x & 1, x \\ 1, x & 1, x \end{array}$$

$$m \times m \rightarrow \mathbb{Q}^{2m-1}$$

- map appropriately the rectangle into a triangle to get a (slightly wasteful) quad. rule
- Otherwise, there are ad hoc rules available (Q 8.2.1) using barycentric coordinates

FD in 2D

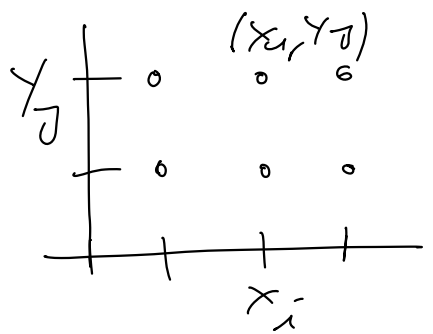

Start with Poisson in 2D:

$$\begin{cases} -\Delta u = f & \Omega = (0, 1)^2 \\ u = 0 & \partial\Omega \end{cases}$$

- Fix a rectangular grid:
 $H_x \times H_y : (x_i, y_j)$ grid points

$$h_x = \frac{1}{N_x}, \quad h_y = \frac{1}{N_y}$$

$$x_i = i h_x \quad ; \quad y_j = j h_y$$

$$u(x_i, y_j) \approx U_{ij}$$

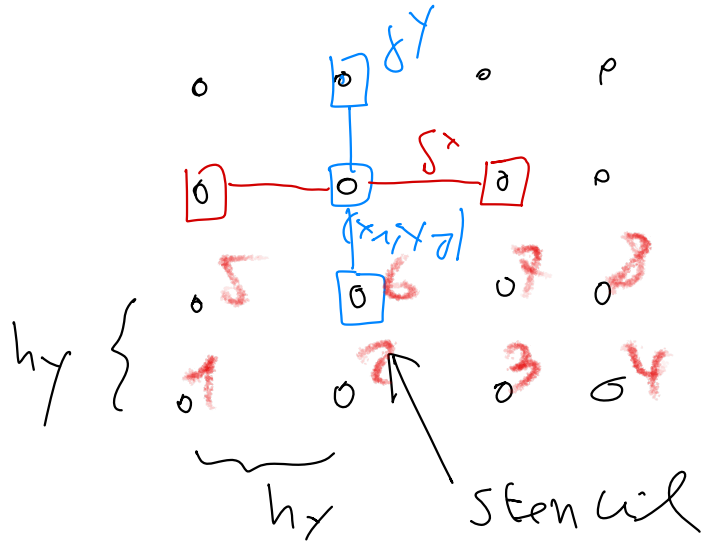

$$\Delta u = u_{xx} + u_{yy} \approx \underbrace{\left(\frac{\partial^2}{\partial h_x^2} \right)^2}_{\downarrow} u(x, y) + \left(\frac{\partial^2}{\partial h_y^2} \right)^2 u(x, y)$$

$$\left(\frac{\partial^2}{\partial h_x^2} \right)^2 u(x, y) = \frac{u(x+h_x, y) - 2u(x, y) + u(x-h_x, y)}{h_x^2}$$

FD method : Find $U = (U_{ij})$:

$$\begin{cases} U_{ij} = 0 & \text{if } (x_i, y_j) \in \partial\Omega \\ \left(\frac{\partial^2}{\partial h_x^2} \right)^2 U_{ij} + \left(\frac{\partial^2}{\partial h_y^2} \right)^2 U_{ij} = -f_{ij} := f(x_i, y_j) \end{cases}$$

STENCIL

→ every eq. has 5 nonzero entries

FD LINEAR SYSTEM

Let $\underline{U} = (U_{1,1}, U_{1,2}, \dots, U_{1,N_x-1}, U_{2,1}, U_{2,2}, \dots, U_{2,N_x-1}, \dots, U_{N_y-1,1}, U_{N_y-1,2}, \dots, U_{N_y-1,N_x-1})$

Let $h_x = h_y = h$ / \dots / $U_{1,N_y-1}, \dots, U_{N_y-1,N_x-1}$
 $N_x = N_y = N$

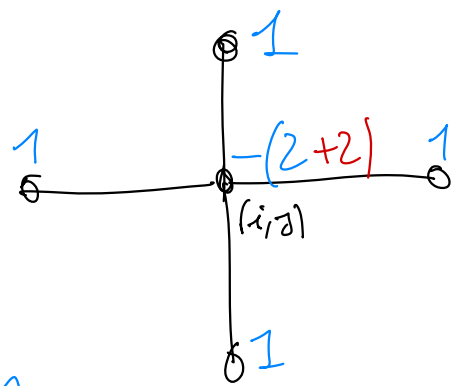

$$\underline{F} = -h^2 \begin{pmatrix} f_{1,1} & \dots & \dots \\ \vdots & \ddots & \vdots \end{pmatrix}$$

$$A = \begin{pmatrix} B & I & \\ I & B & I \\ & & \ddots \end{pmatrix} \quad I = (N-1) \times (N-1) \text{ Identity}$$

$$B = \begin{pmatrix} -4 & 1 & & \\ 1 & -4 & 1 & \\ & \ddots & \ddots & \ddots \\ & & 1 & -4 & 1 \\ & & & 1 & -4 \end{pmatrix}$$

$$(N-1) \times (N-1)$$

$$(\sum_h^x)^2$$

$$(\sum_h^y)^2$$

$\sim N$ bandwidth

$$\begin{pmatrix} -4 & 1 & 0 & \dots & 1 \\ 1 & \ddots & \ddots & \ddots & \\ \vdots & \ddots & \ddots & \ddots & \\ 1 & & & & \\ 0 & & & & \end{pmatrix}$$

pentadiagonal matrix
